Compliance + more.

Your safety is our priority.

There's a lot of talk these days about formaldehyde in wood products. Here are some facts.

Formaldehyde is present everywhere on earth where there is vegetation and terrestrial creatures, like us. Environmental authorities list formaldehyde as one of the most widespread, gaseous components to which all air-breathing life is exposed. Formaldehyde is a natural substance produced by every living organism. In fact, when you exhale, you give off formaldehyde. *Exposure is a matter of degree, not avoidance.*

Our Siteline cabinets meet or exceed the stringent emission standards set forth by the California Air Resources Board or CARB. CARB Phase Two has shown that technologies for both resins and panel manufacturing are capable of delivering composite panel products that emit at, or very near, the emissions levels for natural wood. All Siteline cabinets are CARB II-compliant, and meet or exceed industry standards for safety and durability.

Formaldehyde levels in typical indoor environments are well below concentrations that could trigger sensory irritation in most people. Like a new car, a new cabinet has a “new” smell for a few weeks after finishing. *This is normal.*
